Module 2: Server Configuration & Administration Notes

Prepared by Fadi Sayegh, P.Eng.

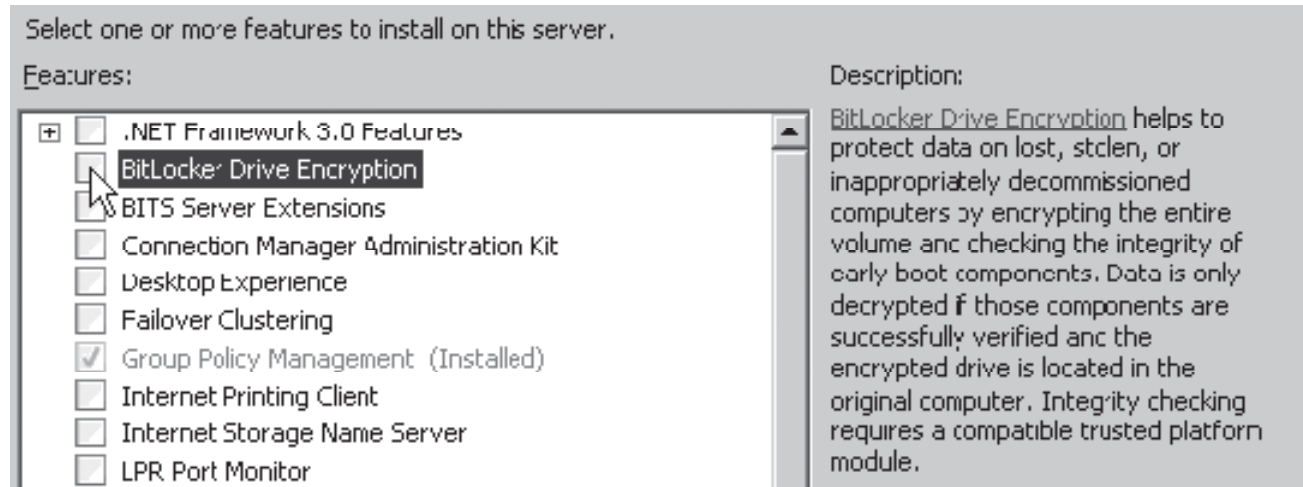

Module Overview

- Manipulate BitLocker Drive Encryption
- Manipulate Remote Desktop Administration
- Manipulate GPT & MBR Disks

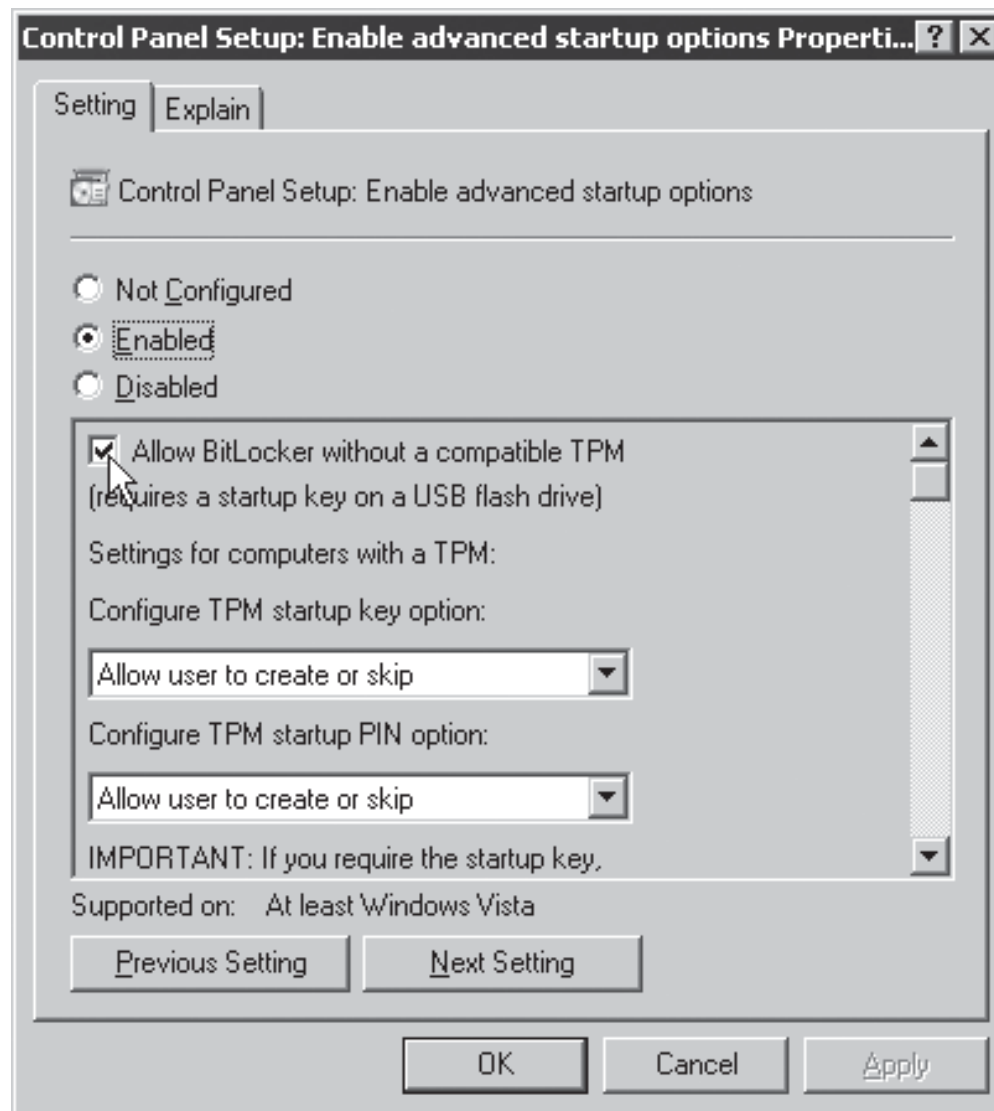

BitLocker

- ▼ BitLocker by itself requiring a USB key
- BitLocker with TPM and no authentication component
- BitLocker with TPM and a USB key
- ▲ BitLocker with TPM and a PIN

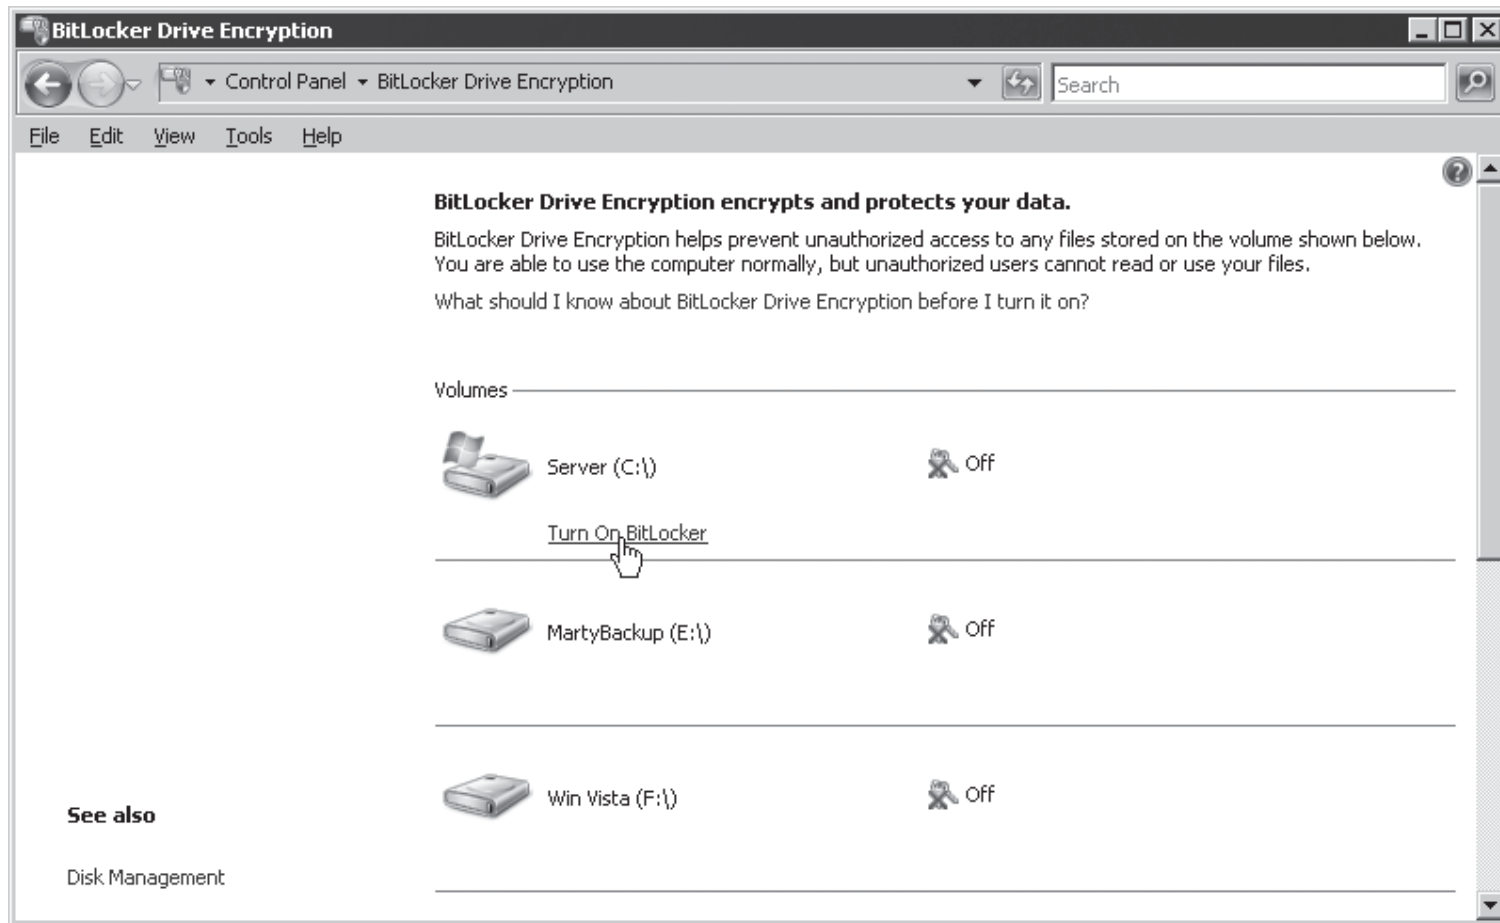

BitLocker Installation

BitLocker Setup and Control

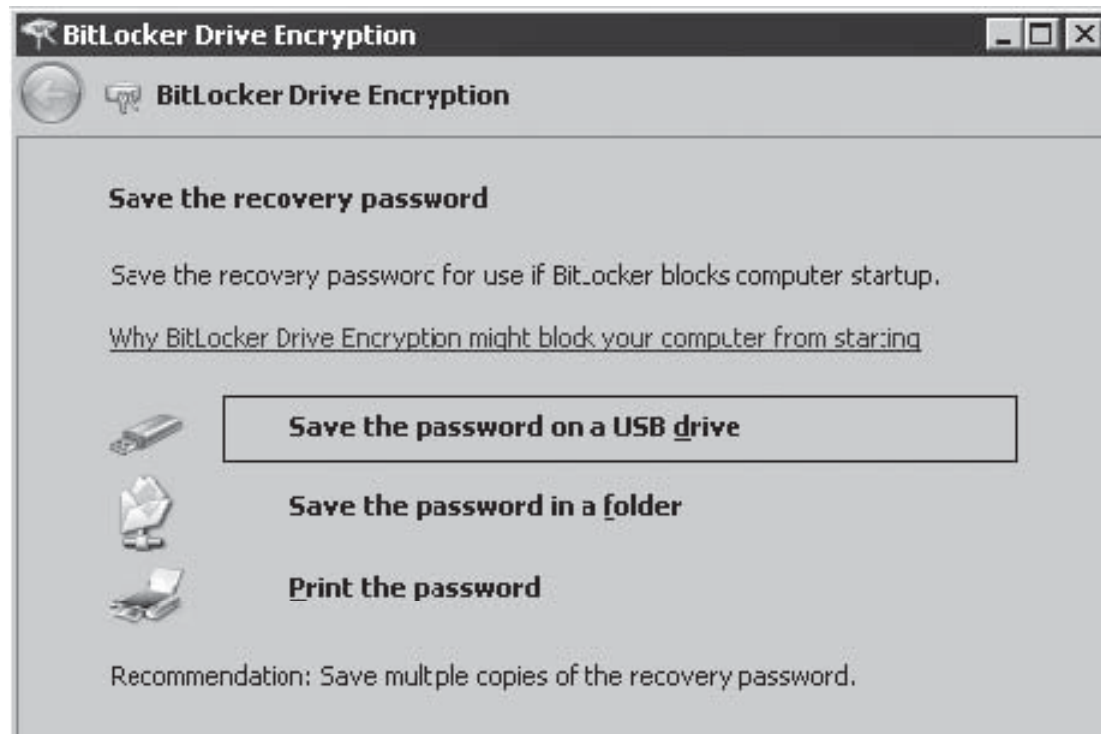

Cont.

You must first enable BitLocker on the System drive, after which you can encrypt the remaining drives on the server.

Cont.

Cont.

Volumes

Server (C:\)

 Encrypting

Turn Off BitLocker Manage BitLocker Keys

MartyBackup (E:\)

 Off

Turn On BitLocker

Win vista (F:\)

 Off

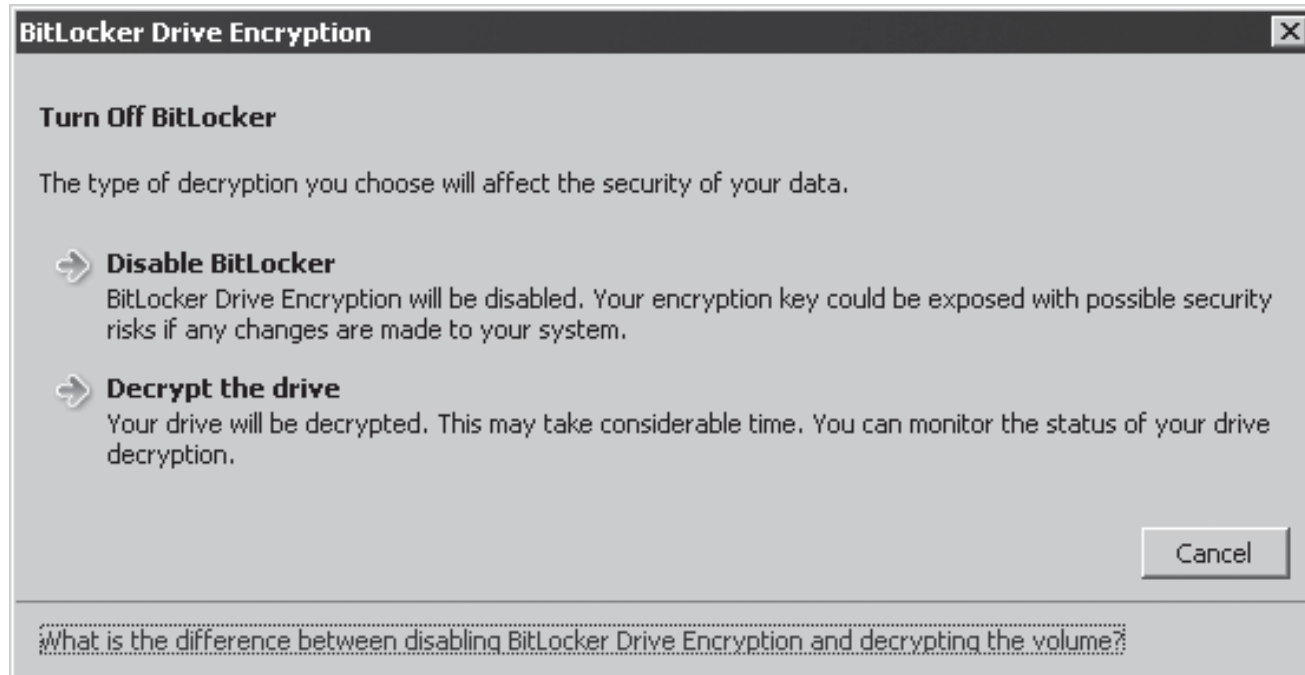

Turn On BitLocker

Use a Computer with BitLocker

- If you create, copy, or move a file on or to a BitLocker drive or volume
- If you copy or move a file from the BitLocker drive or volume to another unencrypted drive
- If you share files on the BitLocker drive
- If the computer you are working on has TPM and you have installed BitLocker

Disable BitLocker

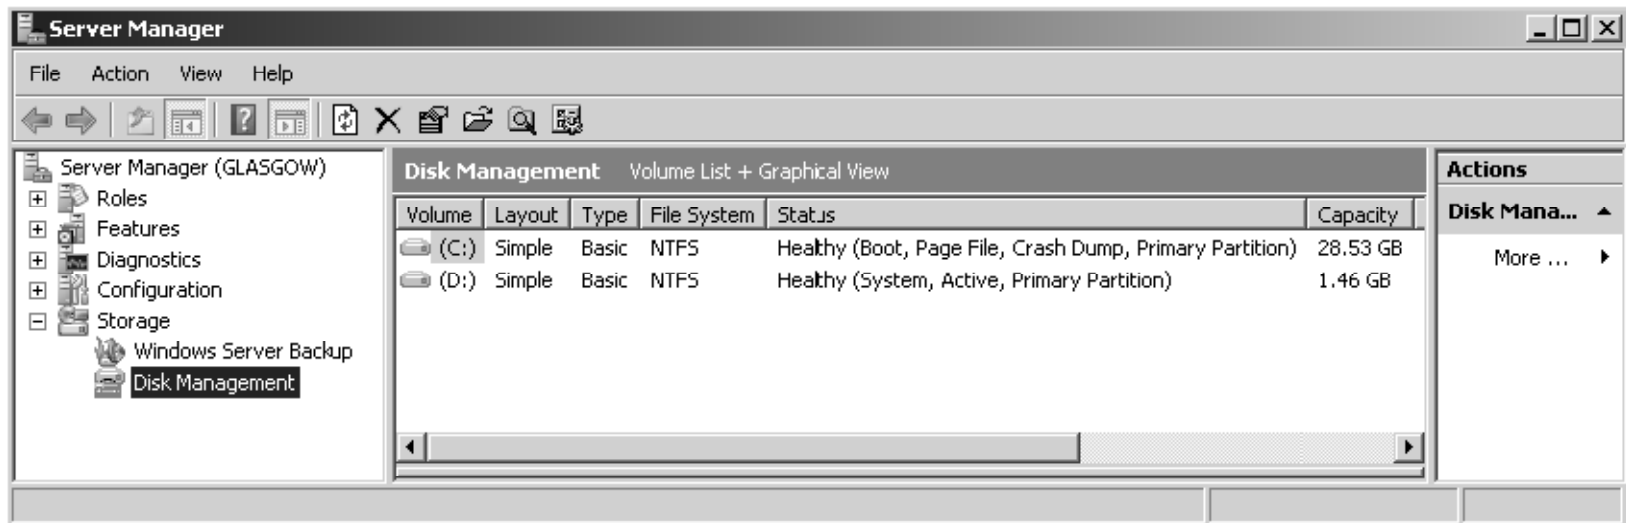

- You can temporarily disable BitLocker

BitLocker Recovery

- If the USB key is not present or the system locks down for some other reason, you get a message that BitLocker has prevented the system from starting and that you should:
 - either insert a USB key (it can be one with the startup key or one with the recovery password) and press esc to reboot,
 - or you should press enter to see a screen where you can enter the recovery password.
- If you don't have a numeric keypad, you can use the function keys as numbers (F1=1, F2=2, F10=0, and so on).
- Once you have entered the correct password, the boot process automatically continues.

BitLocker Volume Configuration

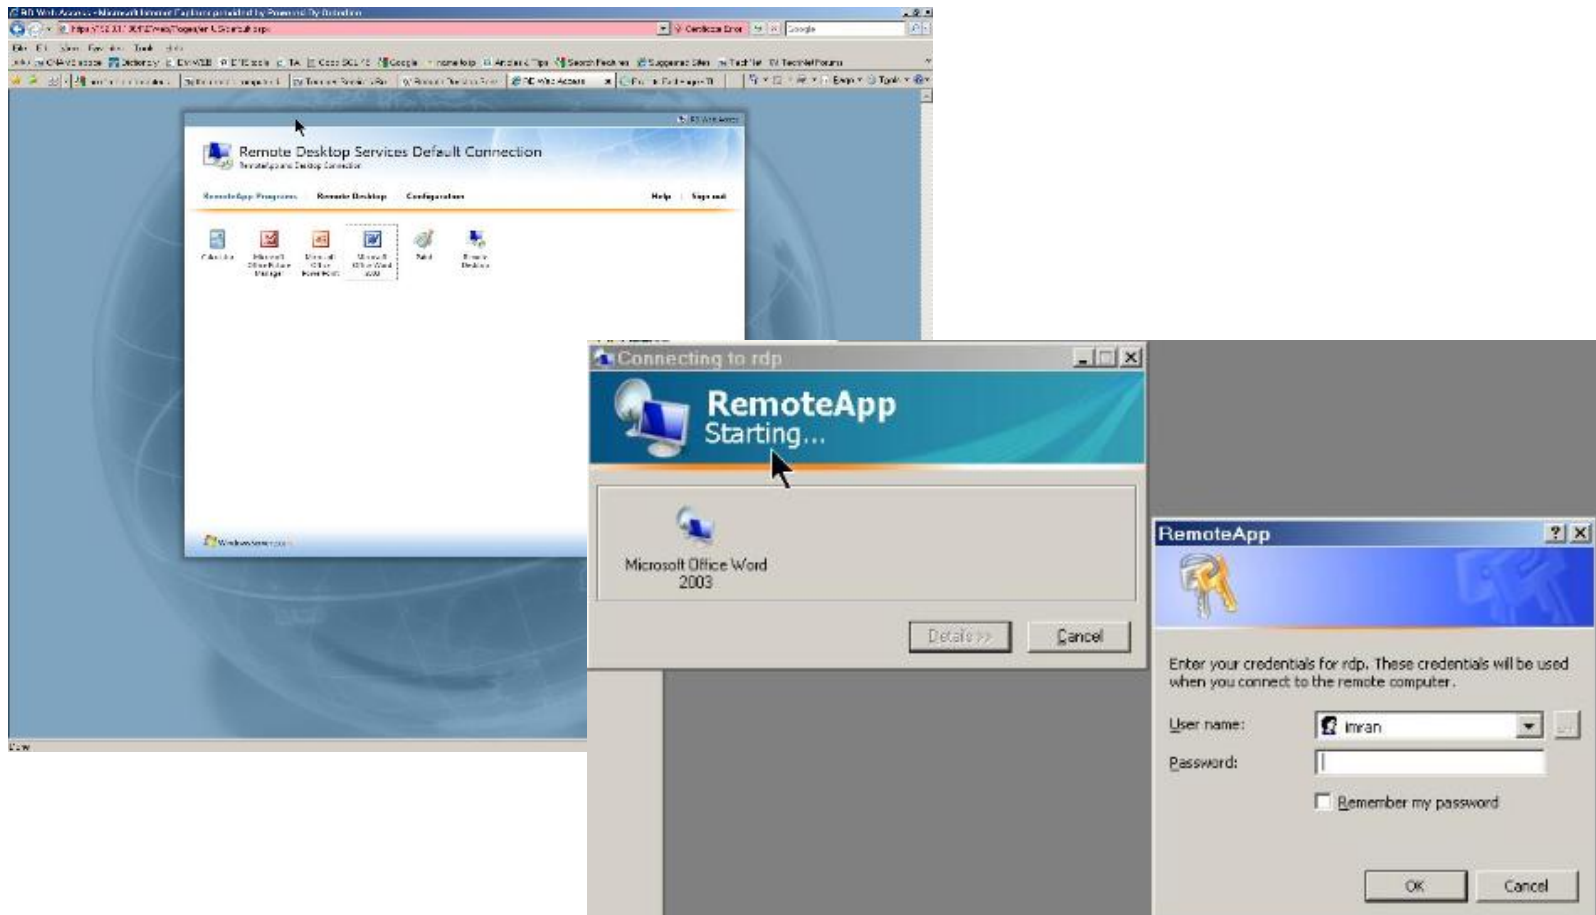

Partition scheme that supports BitLocker

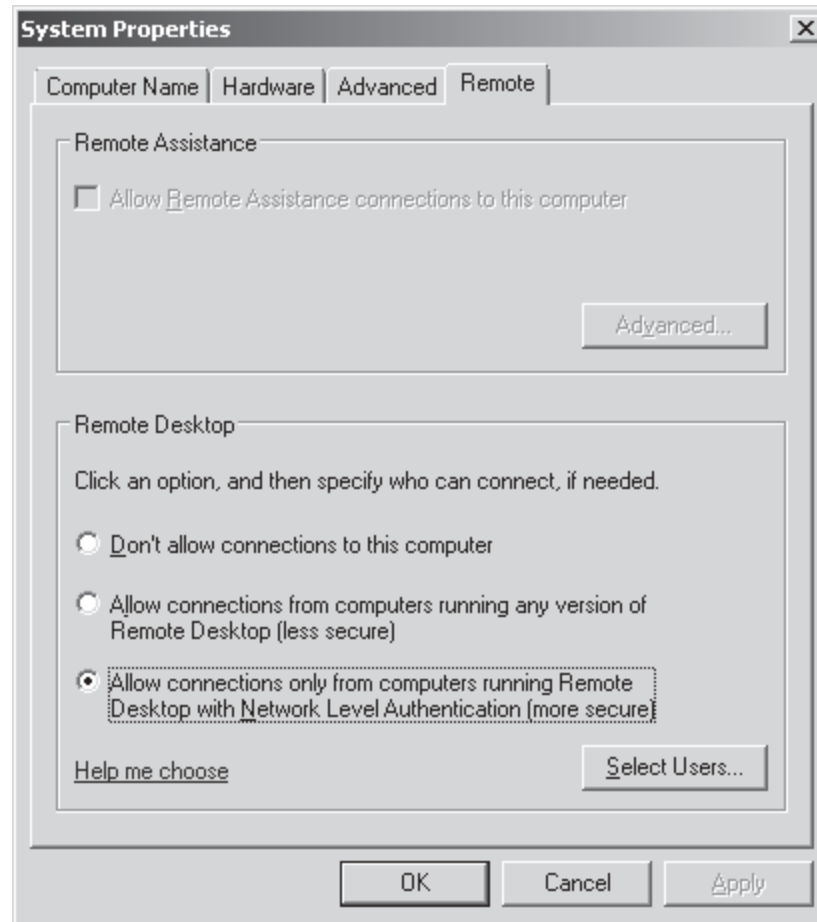

Trusted Computing Group

- TCG
- Goals of this consortium
 - protected (encrypted) hardware
 - Secure boot
 - Attestation
- TPM
