

Question 1

If a tempfile is missing, what will happen at instance startup?

Answers

- ☐ The database will open, but all sorts will proceed in memory.
- ☐ The database will not open.
- ☐ The database will open, but an error will be signaled when the tempfile is needed.
- ☒ The file will be re-created automatically.

Question 2

Explain the role of ARCn and LGWR.

Answers

Question 3

Which statement about the System Global Area (SGA) is true?

Answers

- ☐ The SGA is part of the physical structure of an Oracle database.
- ☒ The SGA is created in an Oracle database environment when an instance is started.
- ☐ The SGA is allocated when the server process is started.
- ☐ The SGA is NOT part of the Oracle server architecture.

Question 4

Which of the following statements is correct about indexes?

Answers

- ☒ An index can be based on multiple columns of a table, but the columns must be of the same datatype.
- ☐ An index can be based on multiple columns of a table, but the columns must be adjacent and specified in the order that they are defined in the table.
- ☐ An index cannot have the same name as a table, unless the index and the table are in separate schemas.
- ☐ None of the above statements is correct.

Question 5

You want to limit the number of transactions that can simultaneously make changes to data in a block, and increase the frequency with which Oracle returns a block back on the free list. Which parameters should you set?

Answers

- ☐ MAXTRANS and PCTFREE
- ☒ INITRANS and PCTFREE
- ☐ INITRANS and PCTUSED
- ☐ MAXTRANS and PCTUSED

Question 6

You are using SQL*Plus from a PC, and the PC reboots while you are in the middle of a transaction. What will happen at the server side?

Answers

- ☐ The statement you were executing will be rolled back, but the rest of the transaction will remain intact.
- ☐ PMON will detect the problem and roll back the transaction.
- ☐ The SQL*Plus auto-commit will commit your transaction.
- ☐ Your server process will detect the problem and roll back the transaction.
- ☒ SMON will detect the problem and roll back the transaction.

Question 7

You are concerned that performance is poor. What might you do to address this?

Answers

- ☒ Ensure that members of the same redo group are on separate disks.
- ☒ Increase the FAST_START_MTTR_TARGET setting.
- ☒ Give each logfile group its own disk, to avoid contention between groups.
- ☒ Carry out manual checkpoints, to advance the checkpoint position.
- ☐ Reduce the FAST_START_MTTR_TARGET setting.
- ☐ Take the database out of archivelog mode.

Question 9

You are creating a data base manually and you need to limit the number of initial online redo log groups and members.

Which two keywords should you use within the create database command to define the maximum number of online redo log files?

Answers

- ☒ MAXLOGFILES, which determines the absolute maximum of online redo log groups.

Question 10

You alter a tablespace's DEFAULT STORAGE settings in the Oracle database to increase the size of initial extents. Which of the following choices identifies when the change will take effect for tables that already exist in that tablespace?

Answers

- ☒ The change takes effect immediately.
- ☐ The change will not take effect for existing tables.
- ☐ The change takes effect when data is removed from the table.
- ☐ The change takes effect when data is added to the table.

Question 11

Which two statements are true regarding extent management in a tablespace?

Answers

- ☐ In a dictionary-managed tablespace, the information on free extents is maintained inside the tablespace.
- ☒ In a locally managed tablespace free extents are managed by bitmap.
- ☐ The extents are allocated immediately after the tablespace is created.
- ☒ Coalescing of freespace is not required in a locally managed tablespace.

Question 12

You issue an UPDATE command, and then a COMMIT.
Put the following actions in the correct order:

- A. Data blocks are copied from the datafiles into the database buffer cache.
- B. Data blocks in the cache are updated.
- C. The log buffer is updated.
- D. The changed blocks are flushed to disk.
- E. The log buffer is flushed to disk.

Question 13

You created a database with two online redo log file groups, one member each. What must you do to provide fault tolerance?

Answers

- ☐ You can do nothing; these characteristics are fixed at creation time.
- ☒ Add two more groups, to mirror the first two.
- ☐ You need do nothing; the second group already mirrors the first.
- ☐ Add one more member to each group.

Question 14

What is Row Chaining?

Answers

Question 15

Which two methods can be used to increase the size of tablespace?

Answers

Question 16

Which files must be synchronized for a database to open?

Answers

- ☐ Datafiles, online redo log files, and the control file
- ☐ The parameter file and the password file
- ☐ All the multiplexed control files copies
- ☒ None. SMON will synchronize all files by instance recovery after opening the database.

Question 17

You have set up password file authentication in your database. You accidentally lost the password file. What would be the effect of this loss on the functional database?

Answers

- ☐ The database will be functional and none of the users will have problems in connecting.
- ☐ The database will be functional but none of the users will be able to connect as SYSDBA.
- ☐ The database shuts down and the password file will be created automatically at the next startup.
- ☒ The database fails and it needs recovery.

Question 18

You are analyzing the components of the redo log mechanisms in your Oracle database.

Which of the following purposes does the CKPT process serve?

Answers

- ☐ Writes current redo log number to datafile headers.
- ☒ Writes redo log information to disk.
- ☐ Writes buffers to disk.
- ☐ Reads information into memory for users.

Question 19

Which of the following memory structures are required, rather than optional, parts of the SGA?

Answers

- ☒ Database buffer cache
- ☒ Shared pool
- ☒ Redo log buffer
- ☐ Java pool
- ☐ Large pool

Question 20

You shut down your instance with SHUTDOWN IMMEDIATE. What will happen on the next startup?

Answers

- ☐ SMON will perform automatic instance recovery.
- ☒ The database will open without recovery.
- ☐ PMON will roll back uncommitted transactions.
- ☐ You must perform manual instance recovery.

Question 21

If an undo segment fills up, what will happen?

Answers

- ☐ The undo segment will increase in size.
- ☐ Transactions will continue in a different undo segment.
- ☐ Another undo segment will be created automatically.
- ☒ The undo tablespace will extend, if its datafiles are set to auto-extend.

Question 22

You want to multiplex a redo log group. Will this involve downtime?

Answers

- ☒ Yes, because logfiles can't be manipulated while the database is open.
- ☐ No, you can always reconfigure logfiles online.
- ☐ Yes, because database logging is controlled by static parameters.
- ☐ No, if your database is in archive log mode.

Question 23

Which of the following could be a contributing factor to "snapshot too old" errors?

Answers

- ☐ Too low a setting for UNDO_RETENTION.
- ☒ Use of "set transaction read only".
- ☐ All of the Choices.
- ☐ Long-running transactions.

Question 24

Describes the difference between an Oracle instance and an Oracle database?

Answers

Question 25

Which statement is true regarding enabling constraints?

Answers

- ☐ ENABLE NOVALIDATE is the default when a constraint is enabled.
- ☒ A constraint that is currently disabled can be enabled in one of two ways: ENABLE NOVALIDATE or ENABLE VALIDATE.
- ☐ Enabling a constraint NOVALIDATE places a lock on the table.
- ☐ Enabling a UNIQUE constraint to VALIDATE does not check for constraint violation if the constraint is deferrable.

Question 26

Which of the following circumstances could result in a corrupted database (note: you have backup and database in archived mode)?

Answers

- ☐ Loss of the system tablespace and the undo tablespace.
- ☐ Loss of all copies of the controlfile.
- ☐ A crash during an instance recovery.
- ☒ None. It is impossible to corrupt an Oracle database.
- ☐ Loss of all copies of the current logfile group.

Question 27

You issue a COMMIT command. Which of the following statements is correct?

Answers

- ☐ The transaction can be rolled back.
- ☒ LGWR writes the changes to the logfiles.
- ☐ CKPT synchronizes the database buffer cache with the datafiles.
- ☐ DBWn writes the changed blocks to the datafiles.
