

Question 9

Why do distance vector protocols have stability features but link state protocols do not have them? (Explain in three lines max)

Answers

Question 7

You are configuring a network. You use a distance vector routing protocol. What could you use to prevent routing loops in the network?

Answer All possible choices to get the mark)

Answers

- ☐ Link-state advertisements (LSA).
- ☐ Hold-down timers.
- ☐ Shortest path first tree.
- ☐ Split horizon.
- ☐ Spanning tree protocol.

Question 9

Why do distance vector protocols have stability features but link state protocols do not have them? (Explain in three lines max)

Answers

Question 11

Why do we need spanning tree support in transparent switches? (Explain in three lines max)

Answers

Question 13

Algorithms that do not allow a router to know the exact topology of an internetwork.

Answers

- ☐ Distance vector algorithms
- ☐ Hybrid algorithms
- ☐ Autonomous algorithms
- ☐ Link-State algorithms

Question 18

How could reducing the number of hops in RIP increase the stability of the

protocol? (Explain in three lines max)

Answers

Question 19

Which of the following describe the router functions?
(Answer All possible choices to get the mark)

Answers

- ☐ Packet filtering.
- ☐ Broadcast forwarding.
- ☐ Collision prevention on a LAN segment.
- ☐ Internet work communication.
- ☐ Packet switching.
- ☐ Broadcast domain enlargement.

Question 20

What are the true statements regarding on OSPF link state database? (Answer All possible choices to get the mark)

Answers

- ☐ Each router has an identical link state database.
- ☐ External routes are imported into a separate link state database.
- ☐ Information in the link state database is used to build a routing table by calculating a shortest path tree.
- ☐ Synchronization of link state databases is maintained via flooding of LSAs.

Question 22

What are the basic characteristics of distance vector and link-state routing protocols? (Choose two, All or nothing)

Answers

- ☐ Distance vector protocols send the entire routing table to directly connected neighbors.
- ☐ Distance vector protocols send updates about directly connected neighbors to all networks listed in the routing table.
- ☐ Link-state routing protocols send the entire routing table to all routers in the network.
- ☐ Link state protocols send updates containing the state of their own links to all other routers on the network.

Question 23

Link-state routers keep track of one of the following:

Answers

- ☐ All routers within the same area
- ☐ Convergence recall
- ☐ Best paths toward a destination
- ☐ Summary table

Question 24

Switches have many modes to handle frame switching. Which one of these modes looks at the destination address and then immediately forwards the frame to the destination?

Answers

- ☐ STORE AND FORWARD
- ☐ HALF DUPLEX
- ☐ FULL DUPLEX
- ☐ FRAGMENTATION
- ☐ CSMA/CD
- ☐ CUT THROUGH

Question 18

In the Performance Logs and Alerts of the Performance Monitor, you can specify to execute a batch file when an alert is triggered.

Answers

- ☐ False
- ☐ True

Question 27

What should a fully qualified domain name (FQDN) include?

Answers

- ☐ The domain name and The suffix (plus any other subdomain information that may apply).
- ☐ The host part and The domain name.
- ☐ The host part, The domain name and The suffix (plus any other subdomain information that may apply).

Question 11

Your organization uses over 100 different types of print devices. Your existing corporate desktop computers are running Windows XP Professional. Your organization is acquiring a new company that uses desktop computers running Windows NT 4.0. The new company's desktop computers will be incorporated into your company without any changes. What must you do to ensure that the clients running Windows NT 4.0 can print to your print devices? Choose the answer that requires the least amount of administrative effort.

Answers

- ☐ Add the printer driver for Windows NT to the existing printers
- ☐ Nothing; the Windows NT-based computers can print by default.
- ☐ Install the printer driver for Windows NT on each Windows XP-based computer.

- ☐ Install the printer driver for Windows XP on each Windows NT 4.0-based computer.

Question 15

The scopes of groups in Active Directory are:

Answers

- ☐ Local and Universal.
- ☐ Security and distribution.
- ☐ Local , Global and universal.
- ☐ Global and universal.

Question 17

Any domain controller can create new objects like users, groups and computer accounts, What is the FSMO required role, when creating big (more than 100) number of objects from the same DC?

Answers

- ☐ Relative ID master.
- ☐ PDC emulator.
- ☐ Schema master.
- ☐ Domain naming master.

Question 25

You're administering a Windows Server 2003 computer configured as a print server. Users in the Marketing group complain that they cannot print documents using a printer on the server. You view the permissions in the printer's properties. The Marketing group is allowed Manage Documents permission. Why these users can't print to the printer?

Answers

- ☐ The Marketing group must be granted the Print permission.
- ☐ The Administrators group must be granted the Manage Printers permission.
- ☐ The Marketing group must be granted the Manage Printers permission.
- ☐ The Everyone group must be granted the Manage Documents permission.

Question 26

Windows Server 2003 requires you to accomplish one task on your system within 30 days of installation.

Answers

- ☐ Register
- ☐ Log in
- ☐ Add users

☐ Activate

Question 1

Mark is a member of the Users group and the Sales group. The Users group has read permission on Folder1, and the Sales group has write permission on Folder1. What is the effective permission that mark has on Folder1?

Answers

- ☐ Write.
- ☐ Full control
- ☐ Read and write
- ☐ Read

Question 3

The highlights of Active Directory in Windows Server 2003 are?

Answers

- ☐ Names, addresses and telephone numbers
- ☐ Security, query capabilities, replication and partitioning
- ☐ Addresses and postal codes only.
- ☐ None of the above

Question 5

You are implementing a network that will include UNIX workstations that will share files and information with the Windows users. What protocols will you need to implement to provide integration with UNIX machines?

Answers

- ☐ NetBEUI
- ☐ IPX/SPX
- ☐ TCP/IP
- ☐ NetBIOS over TCP/IP

Question 7

In AD, each object has a security ID. This ID is a combination of two parts (IDs). What are they?

Answers

- ☐ Domain Constant ID and relative ID.
- ☐ Network ID and Domain controller ID.
- ☐ Domain Constant ID and sub-domain ID.

Question 30

The piece of software that empowers the computer to send data from the CPU to the NIC, when an outgoing message is ready to be sent is:

Answers

- ☐ The redirector.
- ☐ The protocol Stack.
- ☐ The network driver.
- ☐ A network-aware application.

Question 29

You are to back up a Windows Server 2003 file server every evening. You perform a manual, normal backup. You will then schedule a backup job to run every evening for the next two weeks. Which backup type will complete the fastest?

Answers

- ☐ Differential
- ☐ Normal
- ☐ Copy
- ☐ Incremental

Question 16

How do you make a profile mandatory?

Answers

- ☐ Configure the permissions on the folders Sharing property sheet to allow only read permission.
- ☐ Modify the attributes of the profile folder to specify the Read Only attribute.
- ☐ Configure the permissions on the folder's Security property sheet to deny write permission.
- ☐ Rename Ntuser.dat to Ntuser.man

Question 19

Which tool is used to change the infrastructure master?

Answers

- ☐ Domains and trust snap-in.
- ☐ Users and computers snap-in
- ☐ Sites and services snap-in

Question 23

A user informs you that he can log on to his computer but cannot access network resources such as shared folders. You determine that the user has all the appropriate group memberships and permissions, but the user still cannot access shared resources. What may be the cause of this problem?

Answers

- ☐ The user has entered the wrong password.
- ☐ The user has logged on to the local computer instead of the domain.
- ☐ The user has logged on to the domain instead of the local computer.
- ☐ The user has attempted to access a shared folder without appropriate permissions

Question 10

What does Active Directory use to stores all network resources in a hierarchical structure of containers and subcontainers, making them easily accessible and manageable?

Answers

- ☐ Organizational units
- ☐ Sites
- ☐ Objects
- ☐ Domains

Question 9

For a first-time installation of Windows Server 2003, it can be done by:

Answers

- ☐ CD ROM
- ☐ Across the network
- ☐ Automated
- ☐ All of the above.
- ☐ None of the above

Question 13

The SERVER1.TXT, SERVER4.TXT files involve:

Answers

- ☐ Old news that you do need for the installation
- ☐ Critical information about your hardware
- ☐ Some late breaking news not included in the manuals
- ☐ Information about alternate products by Microsoft
