

Question 1

What Windows 2003 Server utility program can you use as a nonadministrator to troubleshoot hardware that is not functioning correctly?

- A. Hardware Troubleshooter
- B. Add or Remove Programs
- C. Add New Hardware Wizard
- D. msconfig.exe

Question 2

As an administrator, you want to be sure no unsigned drivers are installed on your computer. What steps can you take?

- A. Choose Block and also mark the Make This Action the System Default check box in the Driver Signing Options dialog box from the System Properties window.
- B. Choose the Ignore option and also mark the Make This Action the System Default check box in the Driver Signing Options dialog box from the System Properties window.
- C. Choose Ignore in the Driver Signing Options dialog box from the System Properties window.
- D. Choose Block in the Driver Signing Options dialog box from the System Properties window.

Question 3

Morgan is trying to install a new network scanner on the company's Windows Server 2003 computer, but it is not allowing her to begin the installation. The scanner driver was not included with Windows, but it has a Designed for Windows logo, and she has the CD containing the signed driver. What is the most likely cause of the installation problem?

- A. She is not a member of the Power Users group.
- B. She is not a member of the Administrators group.
- C. The scanner is not approved by Microsoft.
- D. The software was written for Windows 3.1.

Question 4

Gina has been given the task of bringing another Active Directory domain online in her corporate network. She does not have enough time to purchase a new server, but she does have several computers running Windows Server 2003, Web Edition, that are underutilized at the moment. She decides to use one of them as a domain controller (DC) for the new domain but cannot promote it. Why not?

- A. The computer does not have enough RAM to become a DC.
- B. The paging file is not on the boot drive, which is a requirement for DCs.
- C. Only Windows Server 2003, Enterprise Edition, can be a DC.
- D. Windows Server 2003, Web Edition, cannot be a DC.

Question 5

Your company's server is beginning to experience slowdowns that you associate with having only a single processor. To alleviate the problems, you install a second processor in the computer. What application can you run in Windows Server 2003 to enable the second processor?

- A. procup.exe in the \support directory of the Windows Server 2003 CD-ROM
- B. Device Manager from the System Control Panel
- C. Processor MMC in the Computer Management MMC
- D. setup.exe from the Windows Server 2003 CD-ROM, choosing the Upgrade to Multiple Processors option

Question 6

A Windows Server 2003 computer in your office has a special video-editing card installed in a PCI slot. This card is vital to the operation of your company. You've been having some minor problems with the card, and you installed a new set of drivers that the manufacturer just released. Unfortunately, the card is now corrupting all the data it processes. What is the best way to solve this problem?

- A. In Device Manager, go into the properties of the device, choose the Drivers tab, and select Roll Back Driver.
- B. Reinstall the original driver from the CD-ROM included with the device.
- C. Download and install the latest beta driver from the manufacturer's Web site.
- D. Manually delete the files associated with the new driver.

Question 7

Mike works in a small company that has recently acquired a new server preinstalled with Windows Server 2003, Standard Edition. The server was purchased with a CD/RW drive so that all employees could copy project data files to the server and then burn archive CDs. They made sure that the drive was on the Hardware Compatibility List when purchasing the server. Mike is attempting to burn an archive CD, but when he right-clicks on the server's CD/RW drive, he does not see Write These Files to CD as a choice. What does he need to do to enable CD burning on Windows Server 2003?

- A. Select CD Burning from Add/Remove Windows Components inside the Add/Remove Programs Control Panel.
- B. Enable CD burning in the local security policy of the Windows Server 2003 computer.
- C. Enable the IMAPI CD-Burning COM Service in the Services MMC snap-in to start automatically.
- D. Update the burner's firmware to a version compatible with Windows Server 2003.

Question 8

While updating your Windows Server 2003 computer, you decide to install a new video driver. Upon rebooting, your monitor reports "Signal out of range." You want to maintain the new driver, but you need to access the display. How can you gain access to the display again so you can change the video settings to functional settings for your environment?

- A. Hold down Ctrl+Alt+Tab and press 1 to force the computer to switch to 640 x 480 resolution.
- B. While booting the machine, press F8 to gain access to the advanced boot menu. Choose Enable VGA Mode to boot into 640 x 480 with 16 colors so you can fix the video settings.
- C. While booting the machine, press F8 to gain access to the advanced boot menu. Choose Safe Mode so you can roll the driver back to the previous version.
- D. Hold down V on the keyboard as the computer boots to enable VGA mode.

Question 9

Johanna has a maintenance program that she needs to run on her Windows Server 2003 computer once per month. The application is extremely resource intensive, and Johanna would like to have as few applications and services loaded as possible when she runs the application. What feature of Windows Server 2003 will help Johanna configure her server to have very few services and devices loaded when she needs to run her application?

- A. Hardware profiles
- B. User profiles
- C. Hardware configuration
- D. Device selection

Question 10

A catastrophic failure causes you to lose two drives in your eight-drive RAID-5 volume. Choose all the tasks related to recovering the data and regaining fault tolerance. (Choose two.)

- A. Replace one drive and allow the rebuild process to begin.
- B. Replace the two failed drives.
- C. Move the remaining drives into a dedicated recovery server and rebuild the array.
- D. Restore the information from your most recent tape.
- E. In Logical Disk Management, right-click the failed volume and choose Restore from Shadow Copy.

Question 11

Windows Server 2003 supports legacy file-system types, such as FAT and FAT32, as well as the latest NTFS file system. Which partition schemes does Windows Server 2003 support on a single IDE hard drive, if you have one extended partition on the same drive? (Choose two.)

- A. Two primary partitions
- B. Four primary partitions
- C. Three simple volumes
- D. One simple volume and one extended partition
- E. Three primary partitions

Question 12

After upgrading your Windows NT 4.0 Server to Windows Server 2003, you no longer can access your stripe set with parity. How can you access the data stored on your stripe set with parity on Windows Server 2003?

- A. Use the ftonline.exe utility in the \Support\Tools folder on the Windows Server 2003 CD-ROM.
- B. Convert the stripe set to a RAID-5 volume using Disk Management in the Computer Management console.
- C. Reboot the computer into Windows NT 4.0 Server and copy the data to an existing dynamic volume.
- D. Use the stripetoraid.exe utility in the \Support\Tools folder on the Windows Server 2003 CD.

Question 13

Which of the following is not a true statement about striped volumes in Windows Server 2003?

- A. Striped volumes provide no fault tolerance for data stored on them.
- B. Striped volumes may be created onto a maximum of 32 disks.
- C. Striped volumes may be extended to add more storage space.
- D. Striped volumes provide better performance than simple volumes.

Question 14

On a multiboot computer with Windows Server 2003, Windows XP Professional, and Windows NT 4.0 Server with SP6, what types of storage volumes are natively accessible to all of these operating systems? (Choose three.)

- A. Primary partition formatted with FAT
- B. Extended partition formatted with FAT32
- C. Extended partition formatted with NTFS
- D. Simple volume formatted with FAT32
- E. Stripe set formatted with NTFS
- F. RAID-5 volume formatted with NTFS
- G. Logical drive formatted with FAT

Question 15

What is the preferred method for running the Disk Defragmenter utility on Windows Server 2003?

- A. Log onto the computer as a user with local administrative privileges and run Disk Defragmenter.
- B. Log onto a different computer as a domain administrator and launch the defragmenter remotely to ensure the least performance impact.
- C. Log onto the computer as a user without administrative privileges, right-click the Disk Defragmenter icon and choose Run as, and type in the credentials of a user account with administrative privileges.
- D. Log onto the computer as an administrative user using Terminal Services and launch Disk Defragmenter.

Question 16

Which of the following defines the system partition in Windows Server 2003?

- A. A simple volume on a dynamic disk that contains the \Windows folder
- B. A spanned volume on a basic disk that contains the boot files such as ntldr, ntdetect.com, and boot.ini
- C. A partition on a basic disk that contains the boot files such as ntldr, ntdetect.com, and boot.ini
- D. A partition on a dynamic disk that contains the \Windows folder

Question 17

After moving a hard disk that contains data from an old Windows Server 2003 computer to a new one, it is listed as Foreign in Disk Management. What can you do to make the data accessible in the new server?

- A. In Disk Management, right-click on the disk and choose Import Foreign Disks.
- B. In Device Manager, enter the properties of the disk and choose Activate This Disk.
- C. In Disk Management, right-click on the disk and choose Activate This Disk.
- D. In Device Manager, enter the properties of the disk and choose Import Foreign Disks.

Question 18

You believe that one of the drives in your mirrored volume is beginning to fail. You want to break the mirror and replace the failing drive. The mirrored volume consists of the physical disks numbered 2 and 3 in Disk Management. The drive letter assigned to the volume is H:. You want to be sure that Disk 3 retains the H: drive letter designation because it is the good disk and it will be retained. You also want to retain the data on the possibly failing disk as a failsafe option in case problems arise during the replacement process. How can you accomplish this? (Choose three.)

- A. Right-click Disk 3 and choose Remove Mirror.
- B. Right-click Disk 3 and choose Break Mirrored Volume.
- C. Right-click Disk 2 and choose Break Mirrored Volume.
- D. Right-click the remaining H: drive, choose Add Mirror, and then choose a dynamic disk with enough unallocated space.
- E. Ensure the new mirrored volume reports a status of Healthy.
- F. Right-click Disk 2 and choose Remove Mirror.
- G. Right-click on the remaining H: drive and choose Add Mirror, choosing another simple volume that is the same size or larger than the volume you are mirroring.

Question 19

Which of the following command-line tools can you use to remove a user from Active Directory?

- A. dsquery
- B. dsrm
- C. dsmove
- D. dsadd
- E. dsget
- F. net user

Question 20

In an Active Directory domain, what does name mapping allow you to do?

- A. Map a user profile to a network share.
- B. Map a user to his home folder.
- C. Log on to a non-Windows Kerberos realm.
- D. Log on to a Windows 2000 child domain.

Question 21

Which networking components must be present on the network to install Active Directory? (Choose two.)

- A. Windows Internet Name Service (WINS)
- B. Domain Name System (DNS)
- C. Kerberos
- D. Remote Procedure Call (RPC)
- E. Transmission Control Protocol/Internet Protocol (TCP/IP)
- F. NetBIOS

Question 22

You plan to raise the functional level of your Active Directory forest to Windows Server 2003. What must you do to fulfill the requirements necessary to do this upgrade? (Choose two.)

- A. Upgrade all the workstations to Windows 2000 Professional or Windows XP Professional.
- B. Upgrade all Windows NT 4.0 member servers to Windows Server 2003.
- C. First upgrade the forest to Windows 2000 native mode.
- D. Make sure all DCs are running Windows 2003 Server.
- E. Raise the domain functional level on all DCs to at least Windows 2003 native mode.
- F. Raise the domain functional level of all the domains in the forest to at least Windows 2000 native mode.

Question 23

How can you identify a prestaged computer account in Active Directory? (Choose two.)

- A. By its fully qualified domain name (FQDN)
- B. By its TCP/IP address
- C. By its computer name
- D. By its globally unique identifier (GUID)
- E. By its security identifier (SID)
- F. By its universally unique identifier (UUID)

Question 24

You have reset the computer account password, but now the user can no longer log on to the domain. What must you do to fix it?

- A. Reset the user account password.
- B. Rejoin the computer to the domain.
- C. Reboot the workstation.
- D. Reset the security identifier.

Question 25

Users on Windows 98 computers who log on to a Windows NT Server 4.0 domain need to be able to access shared folders and printers within a Windows Server 2003 Active Directory environment. What must be in place for this access to occur?

- A. A one-way trust
- B. The dsclient.exe utility installed on all Windows 98 computers
- C. The Kerberos authentication protocol
- D. DNS configured on the Windows 98 computers

Question 26

For a domain set at the Windows 2000 mixed domain functional level, which type of group scope can contain accounts and global groups from any domain in the forest?

- A. Universal groups
- B. Domain local groups
- C. Security groups
- D. Global groups

Question 27

A user complains that she is not able to access a resource that she once could. You suspect that it is a group-policy issue. What is the best way to determine whether group policy is the problem?

- A. Check the group policy for the OU the user is in.
- B. Use dsquery.
- C. Use dsget.
- D. Run the RSoP wizard.

Question 28

MartyB belongs to the Domain Admins group within the CORINTH.LOCAL domain. The Domain Admins group is a group that belongs to the local Administrators group on Windows XP workstations, which are also joined to the CORINTH domain. Which runas command (or commands) does MartyB need to run to execute the Computer Management console with domain administrative credentials? (Choose two.)

- A. runas /user:MARTYB "mmc %windir%\system32\compmgmt.msc"
- B. runas /user:CORINTH\MARTYB "mmc %windir%\system32\compmgmt.msc"
- C. runas /user:MARTYB@CORINTH.LOCAL "mmc %windir%\system32\compmgmt.msc"
- D. runas /user:LOCAL\MARTYB "mmc %windir%\system32\compmgmt.msc"
- E. runas /user:Administrator\MARTYB "mmc %windir%\system32\compmgmt.msc"

Question 29

You are a network administrator for a clothing manufacturer that is headquartered in Sacramento, California. The manufacturing facilities are located in Reno, Nevada, and St. Paul, Minnesota. Both manufacturing facilities are connected to the corporate office by a VPN tunnel over the Internet. You are working from the Sacramento location and you were sent an email request for Remote Assistance (RA) from the local technician in St. Paul. When you attempted to make an RA connection to a Windows 2003 server located in St. Paul, the connection fails. What are two possible reasons for the failure? (Choose two.)

- A. The RA invitation has expired.
- B. RA has not been enabled on the server.
- C. TCP port 3389 is blocked on the firewall.
- D. UDP port 3389 is blocked on the firewall.
- E. You do not have administrative permissions on the server.

Question 30

Services in Application Server mode. After a period of 120 days, your Terminal Server users complain that they can no longer access the Terminal Server. Upon examination of the problem, you realize that you have additional steps to finish. Each correct step is only a portion of the solution. (Choose two.)

- A. Upgrade each client computer to Windows XP Professional or Windows 2000 Professional with SP3.
- B. Install the proper number of Terminal Server Client Access Licenses (TSCALs).
- C. Reboot the Terminal Server every four months.
- D. Install a Terminal Server License Server on your network.
- E. Uninstall Terminal Services and restore the System State from backup. Reinstall Terminal Services and ensure that the users can connect.

Question 31

Which port needs to be open on the firewall that will enable an external user to connect to an internal Terminal Server that is listening on the default port?

- A. TCP port 21
- B. TCP port 8000
- C. TCP port 3398
- D. TCP port 3389

Question 32

You manage two network administrators. Each administrator has left for the day, and you receive a call that a remote Windows 2003 Web server is not responding to HTTP requests. You attempt to establish a connection to this server, but you receive a message that the maximum number of connections has been reached. Through investigation, you realize that your two network administrators left their sessions running. What Terminal Services tool can you use to disconnect one of the sessions so that you can use Terminal Services to connect to the remote Web server?

- A. Terminal Services Manager
- B. Terminal Services Configuration
- C. Terminal Services Licensing
- D. Managing Your Server—Terminal Services Edition

Question 33

Which Terminal Services administration tool would you use to view users, sessions, and processes for current connections running on each Terminal Server?

- A. Active Directory Users and Computers
- B. Terminal Services Configuration
- C. Terminal Services Manager
- D. Terminal Services Licensing

Question 34

You realize you have just sent off an RA invitation by email to the wrong technician. You want the invitation to expire immediately. What steps do you need to perform to ensure that the invitation expires before the default of one hour?

- A. Open the Help and Support Center, click the View Invitation Status option, select the proper Invitation, and then click the Expire button.
- B. Open the Help and Support Center, click the Invite Someone to Help You option, select the proper invitation, and then click the Expire button.
- C. Open the Help and Support Center, click the Invite Someone to Help You option, select the proper invitation, and then click the Delete button.
- D. Open the Control Panel, click the View Invitation Status option, select the proper invitation, and then click the Expire button.

Question 35

Under which Registry subkey will you find the Group Policy Object (GPO) settings for the Remote Assistance feature?

- A. User Configuration\Administrative Templates\System\Remote Assistance
- B. Computer Configuration\Administrative Templates\System\Remote Assistance
- C. Computer Configuration\Windows Settings\Security Settings\Remote Assistance
- D. Computer Configuration\Security Settings\System\Remote Assistance

Question 36

As the network administrator, to better protect your network from data loss through accidental overwrites and deletions, you come up with the following strategies for Server1:

- Incremental backups of the server at 8:00 p.m. nightly
- Full backups of the server on Sundays at 12 noon
- Shadow Copies of Shared Folders scheduled to run twice daily at 10:00 a.m. and 3:00 p.m. for the E: drive

On Thursday, you are working on a document that you stored in the E:\SpecialDocs folder on the server. It contains sensitive information, so instead of sharing the folder, you connect to it using a Remote Desktop Connection to work on the file. You realize that you deleted some information from the file last Monday morning that you now need. Where can you find the latest copy of the document that has the information you need?

- A. On Monday night's incremental backup tape
- B. In the Previous Versions tab on the properties sheet for the file, as long as you connect over the network using the UNC path \\server1\e\$\specialdocs
- C. On Sunday's full backup tape
- D. In the Previous Versions tab on the properties for the file by logging onto the server locally or via Remote Desktop Connection

Question 37

Which three files are required if you need to boot a Windows Server 2003, Web Edition, computer from a floppy disk? (Choose three.)

- A. ntldr
- B. io.sys
- C. boot.ini
- D. ntdetect.com
- E. boot.sys
- F. bootsect.dos

Question 38

Which options are presented to you when you boot the server and press the F8 key to enter the Advanced Startup Options menu? (Choose three.)

- A. Safe Mode with Recovery Console
- B. Safe Mode with Networking Support
- C. Safe Mode with Command Prompt
- D. Recovery Console
- E. Automated System Recovery (ASR)
- F. Last Known Good Configuration

Question 39

While you are working with another operating system on a Windows Server 2003 computer configured for dual-booting, a system-level command overwrites the boot sector. Now, whenever you boot the computer, it boots straight into the other operating system without giving you a chance to even select Windows Server 2003. You want to restore the Windows Server 2003 boot menu for choosing which operating system to run. What steps must you take? (Choose two.)

- A. Use the Windows Server 2003 CD-ROM to boot the computer into the Recovery Console.
- B. After booting into Windows Server 2003, be sure the operating-system selection timeout is greater than zero in the System applet in the Control Panel.
- C. Execute fixboot from the Recovery Console prompt.
- D. Boot with an MS-DOS-based startup disk and execute fdisk /mbr to repair the master boot record.
- E. Perform an ASR to repair the boot sector.

Question 40

Marty wants to create an ASR backup of his company's Windows Server 2003 computer. He has a variety of media that he could create the backup set on. Which media will allow him to successfully recover his server with the fewest configuration changes or questions?

- A. A SCSI hard drive that stores both the system and boot volumes
- B. A tape drive that requires a special driver from the manufacturer
- C. A write once, read many (WORM) optical drive that requires a manufacturer-provided device driver that is connected to the server via a SCSI cable
- D. An IDE hard drive used for data storage only
